

JBossESBDeadLetterService

JBossESB - JBossESBEIP - Dead Letter Service

-

Pattern Description

The Dead Letter Service (DLS) has a category="JBossESB-Internal" and name="DeadLetterService", and is a standard service to which message will be routed when delivery to the intended destination fails.

Implementation

By default the DLS is configured to store the message in the [Message Store](#), with category 'DLQ', status 'undelivered'.

Configuration

The Dead Letter Service is configured in the jbossesb.esb archive, which contains services used by the JBossESB itself.

The [configuration](#)

uses the [MessagePersister](#) to persist messages to the [Message Store](#). Note that the service

JBossESBDeadLetterService

can be configured to for instance deliver the message to a DLQ JMS Queue.
