JBossESBDynamicRouter

JBossESB - JBossESBEIP - Dynamic Router

-

Pattern Description

A Dynamic Router is a Router that can self-configure.

Implementation

Both the Static Router and the Content Based Router are 'hot', which means that the routing config and routing rules can be updated dynamically. We do not yet implement a control channel for our services yet. So you will have use scripting to update the configuration or the routing rules. Control channels will probably a 5.0 feature.
